### **Anomaly**

- 1. There are some users who does not have any data for the given time frame
- 2. There are some users who does not have any data for second week. As we know we must calculate  $r_{1a2a}$ ,  $r_{1a2b}$  and  $r_{2a2b}$  (for Z-Value and P-Value) and for calculating these values we need the data for second week.

Note: - For first anomaly, data in output is empty and for second anomaly data in output has "None" value.

### **Analysis**

For 10 seconds window, total no comparison which has P-Value ≤ 0.05 or Distinguishability equals to "Yes" is 67 and which mean there are 67 user comparison pair which can be easily distinguishable from each other while for 227 windows total pair is 10 and for 300 seconds window the total pair is 6.

As per my understanding, we can say that as the window size increase the degree of Indistinguishability increases and there is a big deference between 10 seconds window data and 227 seconds window data as compared to 227 data and 300 data. Also, there are some users which do not have enough data for proper comparison. So, more data needed for those users for proper correlation.
